

# TAKE OPERATIONAL SAFETY TO THE NEXT LEVEL

The maintenance-free Dynamic Stability System (DSS) helps reduce the likelihood of tip-overs and reminds operators of safe operating practices by monitoring operating conditions and automatically limiting truck functionality when certain unsafe conditions are detected – and it comes standard on all A Series trucks.

DSS actively monitors five integrated maintenance-free sensors during operation to provide information to the Vehicle System Manager (VSM). The VSM will engage DSS by providing audible and visible alerts from the operator display and limiting truck performance. If telemetry is available, the system will also send an alert to the telemetry portal.

Note: While the DSS supports safe truck operation and helps the operator minimize the potential for tip-overs, proper operation of the truck, including 100% full-time and proper utilization of the seatbelt, are the primary and best means of keeping the truck upright and operator safe. Refer to the operator manual and your forklift training program for proper operation.
